

CANADIER WITH BRAKE SUPPORT

Brake INACTIVE

To use the break, push the poles down.

Brake ACTIVE

Highly-efficient rescue sled with integrated brake system for one-man operation.

Because of its flat bottom, the Canadier is designed to be operated in the fall-line, in groomed skiing terrain of all difficulties and snow conditions.

Refined Brake Support System: By pushing the poles of the sled downwards, the rescuer creates an even and fine tunable breaking power.

A simple but effective lever-system increases this power and presses four breaking claws into the snow. Due to this, the Canadier can be braked safely even on steep and icy slopes. In very flat terrain, the brake is fully deactivated by slightly pulling the poles upwards. The sled runs then about as fast as a normal skier.

Three triangular runners, exclusively molded for the Canadier, provide **excellent running-stability**.

Even shape of the sled - only bent upwards at the bow and the wide lying area allow a horizontal and **very comfortable bedding of the injured**, especially together with a vacuum mattress and/or rescue bag. Lying area with **anti-slip mat** for better fixation of the patient.

Long lasting durability: Manufactured completely from high-strength, corrosion resistant aluminum alloy. The triangular runners provide additional stiffness of the sled.

Two detachable poles can be attached with quick locks, equipped with safety loop handles.

Four carrying grips at both ends allow easy lifting of the sled.

Art. No.	93040	
Dimensions	Length:	2.000 mm
	Width:	600 mm
Weight	Total incl. poles:	28,5 kg
Comments	With refined brake support
